

COMMON ACRONYMS IN COMPUTER SCIENCE

AI (Artificial Intelligence)

AI is computer technology that looks like human intelligence. Machines with AI appear to understand human speech, recognize patterns, and learn.

CPU (Central Processing Unit)

The CPU is the main processor that performs calculations and controls most operations in a computer.

CUDA (Compute Unified Device Architecture)

CUDA is a technology from NVIDIA that allows a GPU to perform general computing tasks, not only graphics processing.

DDR5 (Double Data Rate 5)

DDR5 is a modern type of RAM that can transfer data very quickly between the memory and the CPU.

DIMM (Dual Inline Memory Module)

The DIMM is the hardware that stores and processes the computer's temporary memory.

FPS (Frames Per Second)

FPS is the number of images a computer sends to a display every second. A high FPS is important in high quality movies and videogames.

GPU (Graphics Processing Unit)

The GPU is a specialized processor that creates images, video, and 3D graphics for a computer.

HDR (High Dynamic Range)

High Dynamic Range is a display technology that shows brighter colors and greater contrast between light and dark areas.

NVMe (Non-Volatile Memory Express)

NVMe is a fast communication protocol that allows SSD storage devices to transfer data quickly through PCIe.

OLED (Organic Light-Emitting Diode)

OLED is a display technology where each pixel produces its own light, creating very bright colors and deep blacks.

OS (Operating System)

An operating system is the main software that manages hardware and allows users to run programs.

PCIe (Peripheral Component Interconnect Express)

PCIe is a high-speed interface used to connect devices such as GPUs and SSDs to the motherboard.

PSU (Power Supply Unit)

The Power Supply Unit converts electricity from a wall outlet into the correct power for computer components.

RAM (Random Access Memory)

Random Access Memory is temporary working memory where a computer stores data that programs are currently using.

RGB (Red, Green, Blue)

RGB refers to a lighting system that mixes red, green, and blue light to create many colors.

SSD (Solid-State Drive)

A Solid State Drive is a storage device that uses flash memory to store data quickly without moving parts.

USB (Universal Serial Bus)

Universal Serial Bus is a common standard used to connect peripherals and transfer data between devices.

USB-C (Universal Serial Bus Type-C)

USB-C is a modern USB connector type that supports fast data transfer, power delivery, and device connections.

VRAM (Video Random Access Memory)

VRAM is special memory on a GPU used to store image and graphics data.
